DETAILED ACTION

1. After review the arguments presented in the Applicant's response filed 2/17/07, the finality of the previous Office action has been withdrawn, and prosecution on the merits is reopened.

Claim Rejections - 35 USC § 101

2. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

3. Claims 1-21 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter. As per the most recent interpretation of the Interim Guidelines regarding 35 U.S.C. 101, claims 1-21 define non-statutory processes because they merely manipulate an abstract idea (the mathematical manipulation of data (voice information and text)) without a claimed limitation to produce a useful, concrete, tangible result. If the acts of a claimed process manipulate only numbers, abstract concepts or ideas, or signals representing any of the foregoing, the acts are not being applied to appropriate subject matter (Benson, 409 U.S. at 71-72, 175, USPQ at 676). Furthermore, claims define nonstatutory processes if they simply manipulate abstract ideas (Warmerdam, 33 F.3d at 1360, 31 USPQ2d at 1759). Lastly, in evaluating claims in view of 35 U.S.C. 101, the "limited to the technological arts" test is no longer valid (see Annex III of the Interim Guidelines).

Allowable Subject Matter

4. Claims 1-21 are allowable over the prior art of record.

The claim limitations pertaining to a method of discriminating speech from voice-band data (VBD) in a communication network calculating a self similarity ratio value representing a periodicity characteristic and calculating an autocorrelation coefficient value representing a spectral characteristic, along with calculating the self similarity ratio value includes calculating a plurality of different self similarity ratio values and selecting the highest one of the plurality of different self similarity ratio values as the calculated self similarity ratio value is not explicitly taught by the prior art of record.

With respect to the prior art of record, the Sewall reference is directed to a method of signal classification to determine which type of voice-band traffic is being carried. Sewall discloses classifying signals on a communication channel without a periodicity parameter, with the signals being on a channel to be classified. Huang is directed to separating voiced and un-voiced portions of speech to be sent over a communications channel. The apparatus disclosed by Huang operates on signals to be sent, which is distinct and different from the signals actually on the communication channel disclosed by Sewall. And as such it would not have been obvious to one of ordinary skill in the art to combine the teachings of Sewall and Huang.
